Controlled Release Drug Delivery Systems

Controlled release drug delivery employs drug-encapsulating devices from which therapeutic agents may be released at controlled rates for long periods of time, ranging from days to months. Such systems offer numerous advantages over traditional methods of drug delivery, including tailoring of drug release rates, protection of fragile

Controlled Release Delivery System Mayne Pharma specializes in the formulation and production of technologies that permit controlled-release of active pharmaceutical ingredients (APIs) in pellets. We focus on all drugs in pellet form achieving a highly desired physicochemical and pharmacokinetic profile, which ensures finely controlled dosing and optimal drug efficacy.

Controlled Release Delivery System - Mayne Pharma

The basic rationale of a controlled release drug delivery system is to optimize the biopharmaceutics, pharmacokinetics, and pharmacodynamics properties of a drug in such a way that its utility is maximized through reduction in side effects and cure or control of disease condition in the shortest possible time by using smallest quantity of drug, administered by most suitable route.

12.2.3 Polymer-Based Drug Delivery Systems Polymers applied to controlled drug release are often referred to as treatment polymers. The main purpose of the application of polymers for drug delivery systems is in controlled drug release. In these usages, drugs are trapped or mixed in polymer matrices (Vilar et al., 2012).

Extended-release drugs, also known as sustained-release drugs and long-acting drugs, are another type of controlled-release medication. These drugs extend drug release to maintain a constant level of medication within the body. An advantage of this type of drug delivery is the elimination of drug burst.

Drug delivery technologies modify drug release profile, absorption, distribution and elimination for the benefit of improving product efficacy and safety, as well as patient convenience and compliance. Drug release is from: diffusion, degradation, swelling, and affinity-based mechanisms.

Drug delivery - Wikipedia

Site-controlled release is usually controlled by environmental factors, like the pH or enzymes present in the intestinal tract, whereas the drug release from time-controlled systems is controlled primarily by the delivery system and, ideally, not by the environment.
